## Neural Network Basics

Latest Submission Grade 100%

1. What does a neuron compute?

1 / 1 point

- ☐ A neuron computes the mean of all features before applying the output to an activation function
- ☒ A neuron computes a linear function ( $z = Wx + b$ ) followed by an activation function
- ☐ A neuron computes a function  $g$  that scales the input  $x$  linearly ( $Wx + b$ )
- ☐ A neuron computes an activation function followed by a linear function ( $z = Wx + b$ )

✓ Correct

Correct, we generally say that the output of a neuron is  $a = g(Wx + b)$  where  $g$  is the activation function (sigmoid, tanh, ReLU, ...).

2. Which of these is the "Logistic Loss"?

1 / 1 point

- ☐  $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \max(0, y^{(i)} - \hat{y}^{(i)})$
- ☐  $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} - \hat{y}^{(i)}|$
- ☒  $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)} \log(\hat{y}^{(i)}) + (1 - y^{(i)}) \log(1 - \hat{y}^{(i)}))$
- ☐  $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} - \hat{y}^{(i)}|^2$

✓ Correct

Correct, this is the logistic loss you've seen in lecture!

3. Suppose `img` is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

1 / 1 point

- ☐ `x = img.reshape((32*32,3))`
- ☐ `x = img.reshape((3,32*32))`
- ☒ `x = img.reshape((32*32*3,1))`
- ☐ `x = img.reshape((1,32*32,*3))`

✓ Correct

4. Consider the two following random arrays  $a$  and  $b$ :

1 / 1 point

$a = \text{np.random.randn}(2, 3)$  #  $a.\text{shape} = (2, 3)$

$b = \text{np.random.randn}(2, 1)$  #  $b.\text{shape} = (2, 1)$

$c = a + b$

What will be the shape of  $c$ ?

- ☐  $c.\text{shape} = (3, 2)$
- ☐  $c.\text{shape} = (2, 1)$

☐ The computation cannot happen because the sizes don't match. It's going to be "Error"!

☒ c.shape = (2, 3)

Correct

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

5. Consider the two following random arrays  $a$  and  $b$ :

$a = \text{np.random.randn}(4, 3) \# a.\text{shape} = (4, 3)$

$b = \text{np.random.randn}(3, 2) \# b.\text{shape} = (3, 2)$

$c = a * b$

What will be the shape of  $c$ ?

☐ c.shape = (3, 3)

☐ c.shape = (4, 3)

☐ c.shape = (4, 2)

☒ The computation cannot happen because the sizes don't match. It's going to be "Error"!

Correct

Indeed! In numpy the "\*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

6. Suppose you have  $n_x$  input features per example. Recall that  $X = [x^{(1)} x^{(2)} \dots x^{(m)}]$ . What is the dimension of  $X$ ?

☐  $(m, 1)$

☒  $(n_x, m)$

☐  $(1, m)$

☐  $(m, n_x)$

Correct

7. Recall that  $\text{np.dot}(a, b)$  performs a matrix multiplication on  $a$  and  $b$ , whereas  $a * b$  performs an element-wise multiplication.

Consider the two following random arrays  $a$  and  $b$ :

$a = \text{np.random.randn}(12288, 150) \# a.\text{shape} = (12288, 150)$

$b = \text{np.random.randn}(150, 45) \# b.\text{shape} = (150, 45)$

$c = \text{np.dot}(a, b)$

What is the shape of  $c$ ?

☐ c.shape = (12288, 150)

☐ c.shape = (150, 150)

☒ c.shape = (12288, 45)

☐ The computation cannot happen because the sizes don't match. It's going to be "Error"!

Correct

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

1 / 1 point

1 / 1 point

1 / 1 point

1 / 1 point

8. Consider the following code snippet:

```
# a.shape = (3, 4)
# b.shape = (4, 1)

for i in range(3):
    for j in range(4):
        c[i][j] = a[i][j] + b[j]
```

How do you vectorize this?

- ☒  $c = a + b.T$
- ☐  $c = a + b$
- ☐  $c = a.T + b$
- ☐  $c = a.T + b.T$

✓ Correct

1 / 1 point

9. Consider the following code:

```
a = np.random.randn(3, 3)
b = np.random.randn(3, 1)
c = a * b
```

What will be  $c$ ? (If you're not sure, feel free to run this in python to find out).

- ☒ This will invoke broadcasting, so  $b$  is copied three times to become  $(3,3)$ , and  $*$  is an element-wise product so  $c.shape$  will be  $(3, 3)$
- ☐ This will multiply a  $3 \times 3$  matrix  $a$  with a  $3 \times 1$  vector, thus resulting in a  $3 \times 1$  vector. That is,  $c.shape = (3,1)$ .
- ☐ It will lead to an error since you cannot use  $*$  to operate on these two matrices. You need to instead use  $np.dot(a,b)$
- ☐ This will invoke broadcasting, so  $b$  is copied three times to become  $(3, 3)$ , and  $*$  invokes a matrix multiplication operation of two  $3 \times 3$  matrices so  $c.shape$  will be  $(3, 3)$

✓ Correct

1 / 1 point

10. Consider the following computation graph.

What is the output  $J$ ?

- ☐  $J = a*b + b*c + a*c$
- ☐  $J = (c - 1)*(b + a)$

☒  $J = (a - 1) * (b + c)$

☐  $J = (b - 1) * (c + a)$

✓ **Correct**

Yes,  $J = u + v - w = a*b + a*c - (b + c) = a * (b + c) - (b + c) = (a - 1) * (b + c)$ .
